"Reducing the world to mathematical equations!"

First, a word from Dr. Larry Fleinhardt

"Reducing the world to mathematical equations!"

First, a word from Dr. Larry Fleinhardt

"Let me guess, you tried to solve a problem involving human behavior and it blew up in your face. Charles, you are a *mathematician*; you are always looking for the elegant solution. **Human behavior is rarely, if ever, elegant.**

Perhaps you need to make your equation, **less elegant, more complicated, less precise, more descriptive**. It's not going to be as pretty, but it might work a little better."

"Reducing the world to mathematical equations!"

Not to be pedantic...

- Many things you will see will seem obvious
 - Industry doesn't use them
 - Why not?
- Many things you will see will seem simple
 - Complicated isn't always the answer
 - Why does it need to be?
- Only the results matter.

"Reducing the world to mathematical equations!"

What makes a game a game?

“A game is
a series of
interesting
choices.”

- Sid Meier

"Reducing the world to mathematical equations!"

What are we trying to do?

We aren't solving an equation.

We are trying to replicate behavior.

"Reducing the world to mathematical equations!"

Interesting Opponents Make for Interesting Choices

- Predictable vs. unpredictable
- Static vs. dynamic
- Shooting gallery vs. realistic

But how?

"Reducing the world to mathematical equations!"

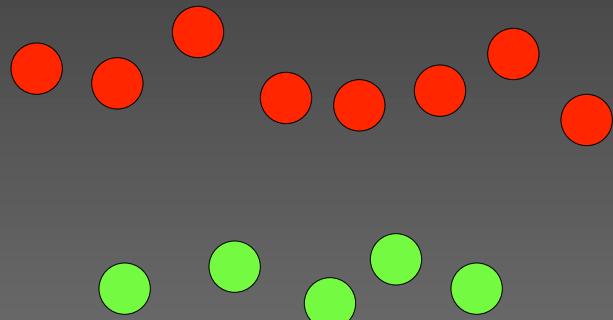

Know when to walk away...

- Design Decision:
“Enemies don’t always fight to the death”
- Enemies can sometimes retreat
 - Flat % chance
 - Is random... therefore looks random
 - Not realistic
 - Situational random
 - Based on circumstances
 - Circumstances are flexible and dynamic

“Reducing the world to mathematical equations!”

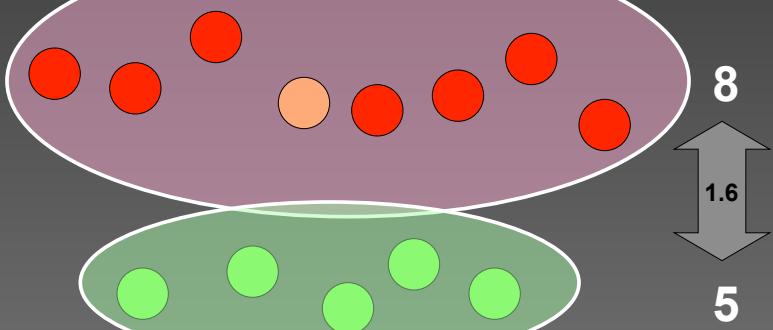

Know when to walk away...

“Reducing the world to mathematical equations!”

Know when to walk away...

How many on my side are still fighting?

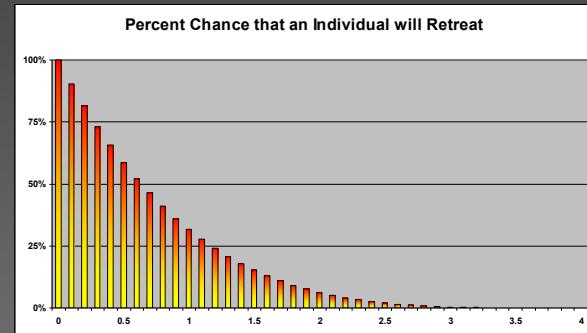

How many of my enemies are still fighting?

“Reducing the world to mathematical equations!”

Know when to walk away...

$$\text{PercentChance} = (4 - \text{Ratio})^3 / (4^3)$$

“Reducing the world to mathematical equations!”

Know when to walk away...

$$\text{PercentChance} = (4 - \text{Ratio})^4 / (4^4)$$

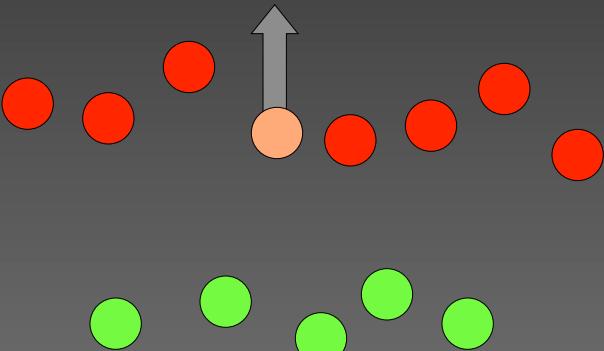

$$\text{PercentChance} = (4 - 1.6)^4 / (4^4)$$

$$\text{PercentChance} = 13\%$$

"Reducing the world to mathematical equations!"

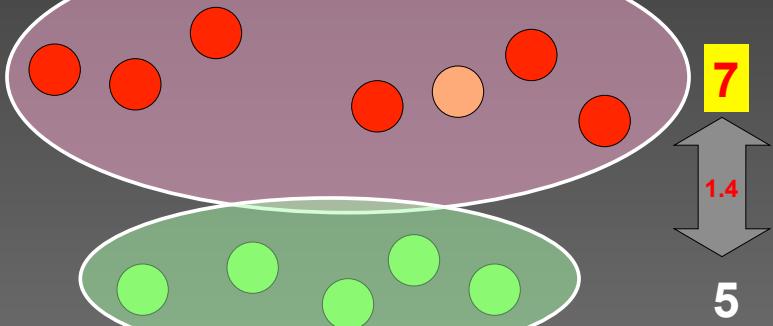

Know when to walk away...

"Reducing the world to mathematical equations!"

Know when to walk away...

How many on my side are still fighting?

"Reducing the world to mathematical equations!"

Know when to walk away...

$$\text{PercentChance} = (4 - \text{Ratio})^4 / (4^4)$$

$$\text{PercentChance} = (4 - 1.4)^4 / (4^4)$$

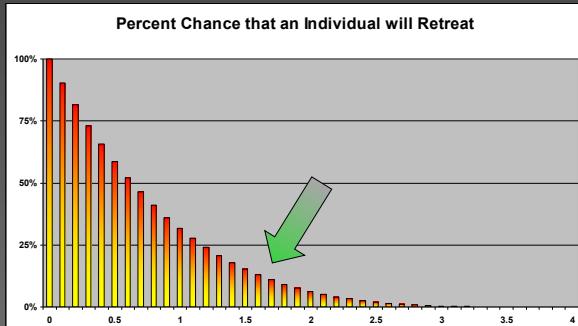

$$\text{PercentChance} = 18\%$$

"Reducing the world to mathematical equations!"

Know when to walk away...

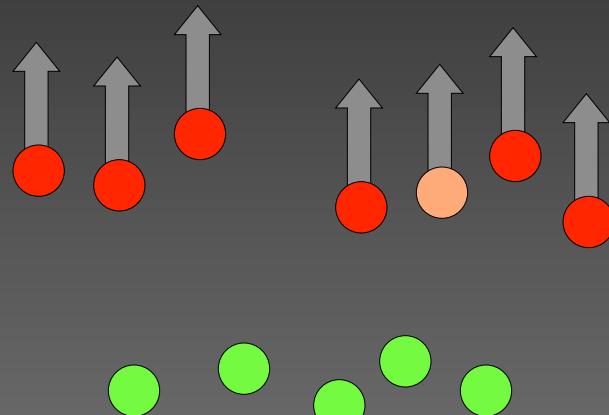

$$\text{PercentChance} = (4 \times \text{Ratio})^4 / (4^4)$$

"Reducing the world to mathematical equations!"

Know when to walk away...

"Reducing the world to mathematical equations!"

Know when to walk away...

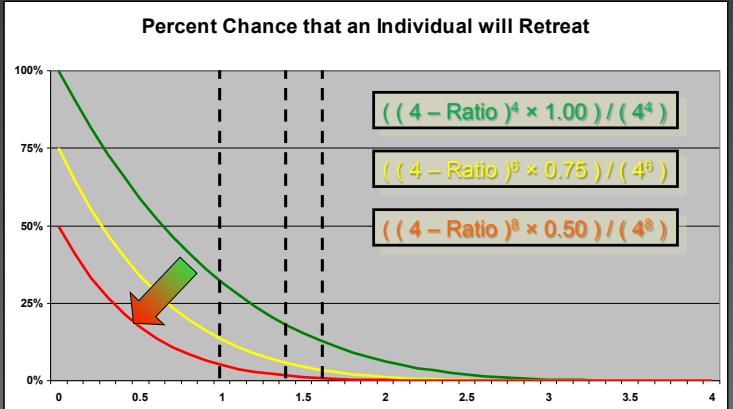

$$\text{PercentChance} = ((\text{MaxRatio} - \text{Ratio})^k \times \text{MaxPct}) / (\text{MaxRatio}^k)$$

	MaxPct	k
In Field	1.00	4
Near Base	0.75	6
In Base	0.50	8

"Reducing the world to mathematical equations!"

Know when to walk away...

"Reducing the world to mathematical equations!"

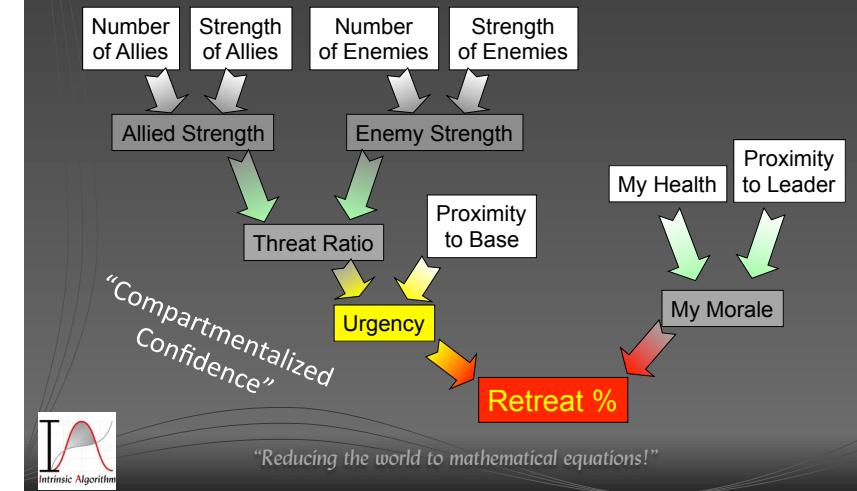

Know when to walk away...

- Factors to Consider
 - Number of allies
 - Number of enemies
 - Proximity to Base
 - Strength of allies
 - Strength of enemies
 - My own health
 - Proximity of my leader

"Reducing the world to mathematical equations!"

Know when to walk away...

How does this look to the players?

- Enemies aren't completely fearless
- They are slightly unpredictable
- They are still reasonable
- Curiosity: "Where is he going?"
- "If we show force, they might break and run."
- "If we back them up, they are more aggressive."
- We have to react to their reactions.

"Reducing the world to mathematical equations!"

Utility Theory

"Reducing the world to mathematical equations!"

What is “Utility Theory”?

<http://en.wikipedia.org/wiki/Utility>

In economics, utility is a measure of the relative satisfaction from, or desirability of, consumption of various goods and services.

Given this measure, one may speak meaningfully of increasing or decreasing utility, and thereby explain economic behavior in terms of attempts to increase one's utility.

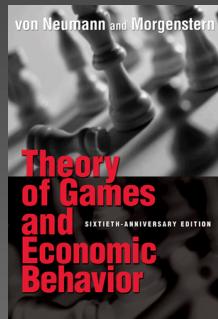

“Reducing the world to mathematical equations!”

What is “Utility Theory”?

- Related to...
 - Game theory
 - Decision theory
- Used by...
 - Economics
 - Business
 - Psychology
 - Biology

John von Neumann

What is “Utility Theory”?

- How much is something worth to me?
- Not necessarily equal to “value”
 - E.g. \$20 might mean more or less than \$20
- Allows comparisons between concepts
- Allows decision analyses between competing interests
- “Maximization of expected utility”

“Reducing the world to mathematical equations!”

Value Allows Analysis

- Converting raw numbers to usable concepts
 - Distance
 - Ammo
 - Health
- Converting raw numbers to useful concepts
 - Distance → Threat
 - Ammo → Reload Necessity
 - Health → Heal Necessity

“Reducing the world to mathematical equations!”

Value Allows Comparisons

- By assigning value to a selection, we can compare it to others
- Von Neumann and Morgenstern's game theory
- Without value, comparisons are difficult... or even impossible!

		Prisoner A	
		Stay silent	Betray
Prisoner B	Stay silent	Each serves	A:  B: 
	Betray	A:  B: 	Each serves 

"Reducing the world to mathematical equations!"

Marginal Utility

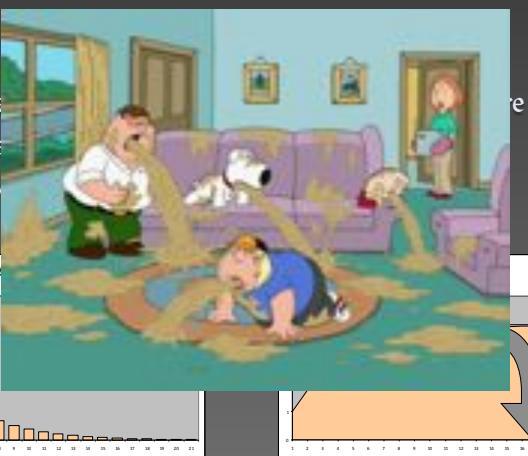

- Utility isn't always the same

"Reducing the world to mathematical equations!"

Marginal Utility

- Decreasing Marginal Utility
 - Each additional unit adds less utility
 - The rate of increase of total utility decreases
 - Utility of 20 Legos != 20 * Utility of 1 Lego

"Reducing the world to mathematical equations!"

Marginal Utility

- Increasing Marginal Utility
 - Each additional unit is worth more than the one before
 - The rate of increase of the total utility increases
 - Utility of 20 Legos != 20 * Utility of 1 Lego

"Reducing the world to mathematical equations!"

Converting Data to Concepts

- What does the information say?
- Raw data doesn't mean much without context
- If data is ambiguous, we can't reason on it
- Various techniques to make sense of raw data
 - Conversion formulas
 - Response curves
 - Normalization (e.g. 0..1)

"Reducing the world to mathematical equations!"

Processing One Piece of Info

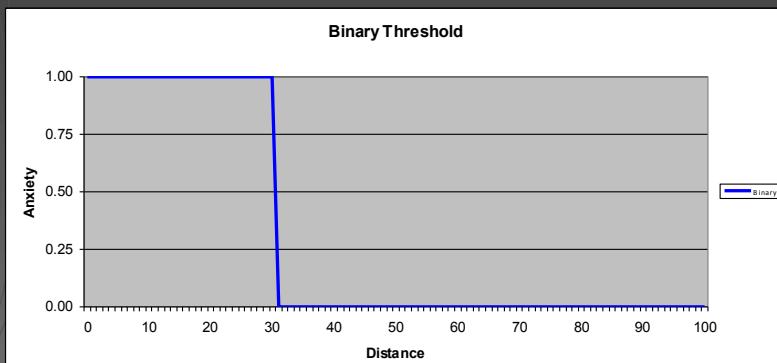

As the distance changes,
how much anxiety do you have?

"Reducing the world to mathematical equations!"

Simple Rule

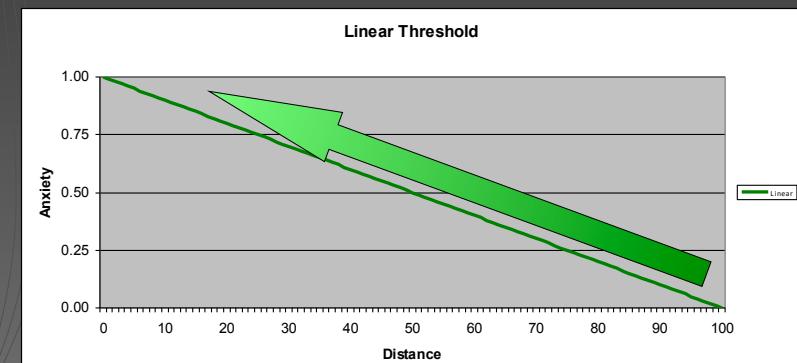

If distance <= 30 then anxiety = 1

"Reducing the world to mathematical equations!"

Linear Formula

Anxiety = $(100 - \text{distance}) / 100$

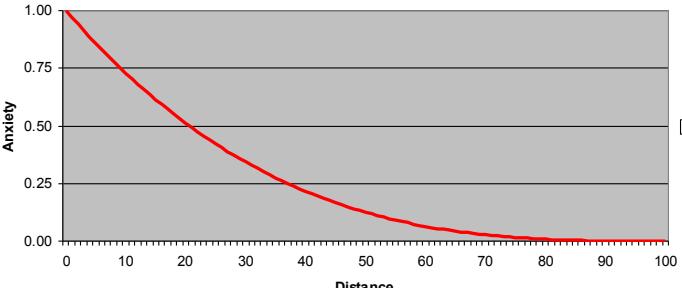

"Reducing the world to mathematical equations!"

Exponential Formula

$$\text{Anxiety} = (100 - \text{distance}^3) / (100^3)$$

Exponential Threshold

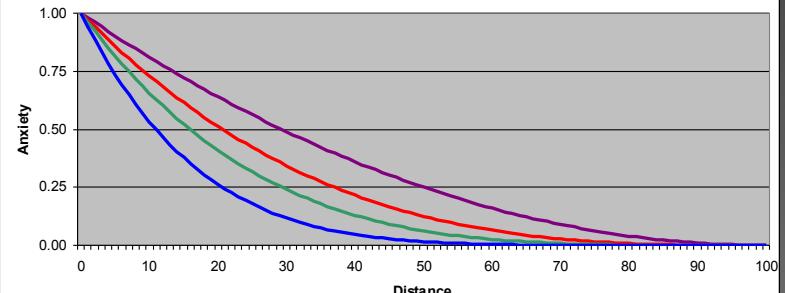

"Reducing the world to mathematical equations!"

Changing Exponents

$$\text{Anxiety} = (100 - \text{distance}^k) / (100^k)$$

$k = 2, 3, 4, 6$

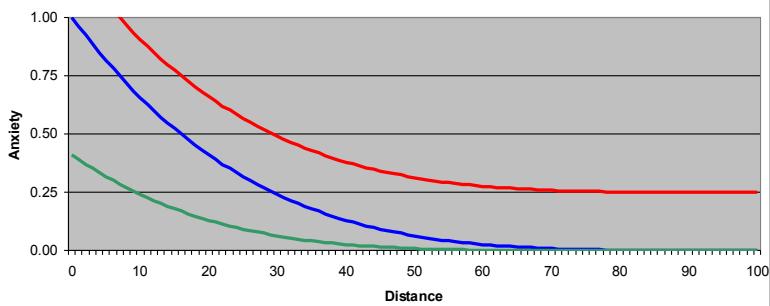

Exponent Function Variations

"Reducing the world to mathematical equations!"

Shifting the Curve

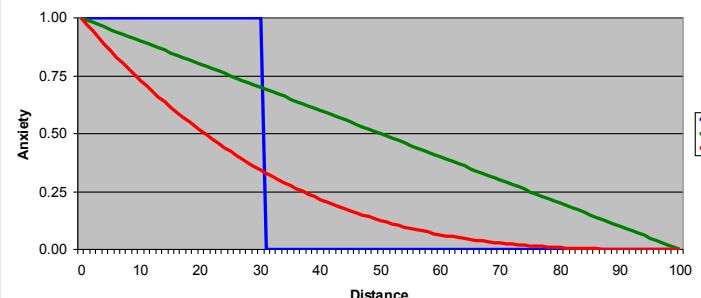

Exponent Function Variations

Exponential Threshold

"Reducing the world to mathematical equations!"

Logistic Function

(One of the sigmoid – or “s-shaped” – functions)

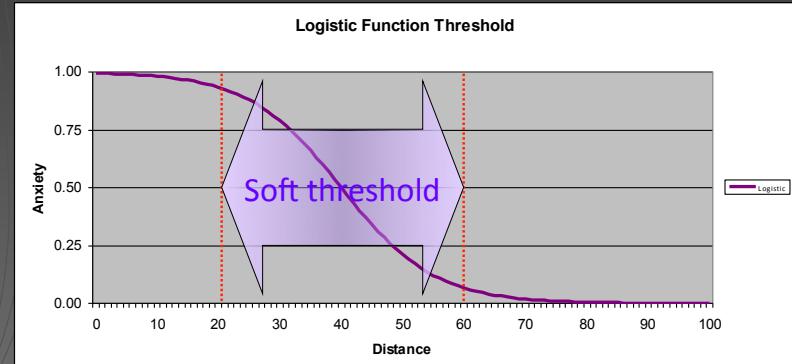

$$y = \frac{1}{1 + e^{-x}}$$

“Reducing the world to mathematical equations!”

Logistic Function

$$\text{Anxiety} = \frac{1}{1 + (2.718 \times 0.45)^{\text{distance}+40}}$$

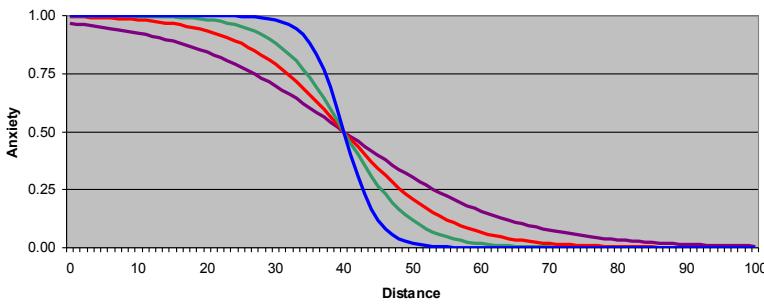

“Reducing the world to mathematical equations!”

Variations on the Logistic Curve

$$\text{Anxiety} = \frac{1}{1 + (2.718 \times 0.45)^{\text{distance}+40}}$$

Logistic Function Variations

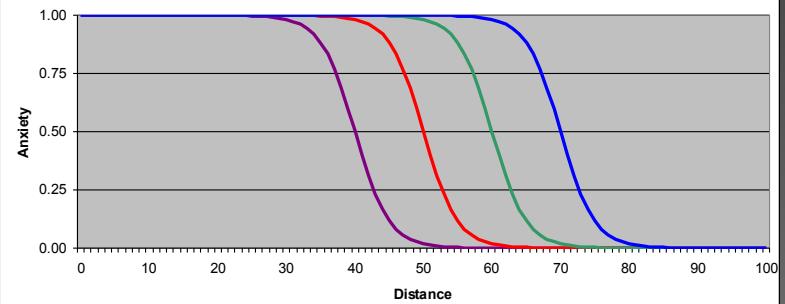

“Reducing the world to mathematical equations!”

Shifting the Logistic Function

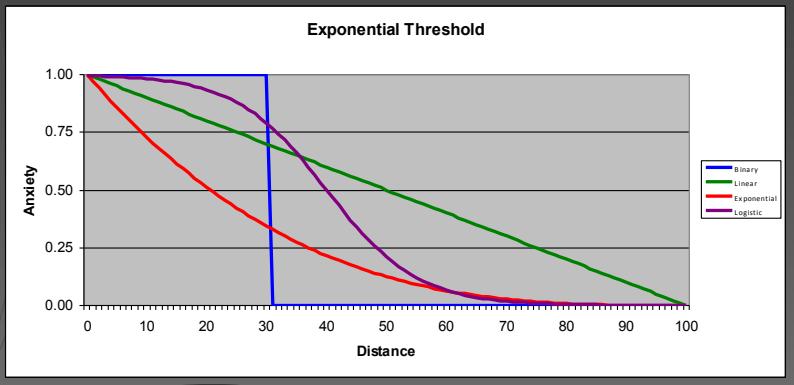

$$\text{Anxiety} = \frac{1}{1 + (2.718 \times 0.45)^{\text{distance}+40}}$$

Logistic Function Variations

“Reducing the world to mathematical equations!”

Curve Comparison

"Reducing the world to mathematical equations!"

Logit Function

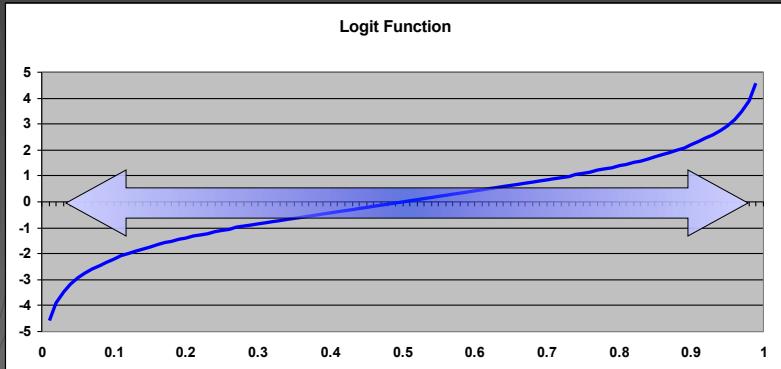

$$y = \log_e \frac{1}{1 - x}$$

"Reducing the world to mathematical equations!"

Logit Function

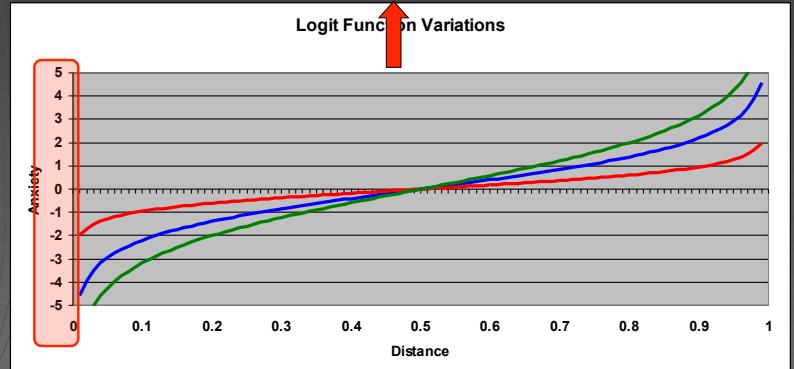

$$y = \log_e(x/(1-x))$$

"Reducing the world to mathematical equations!"

Logit Function

$$y = \log_e(x/(1-x))$$

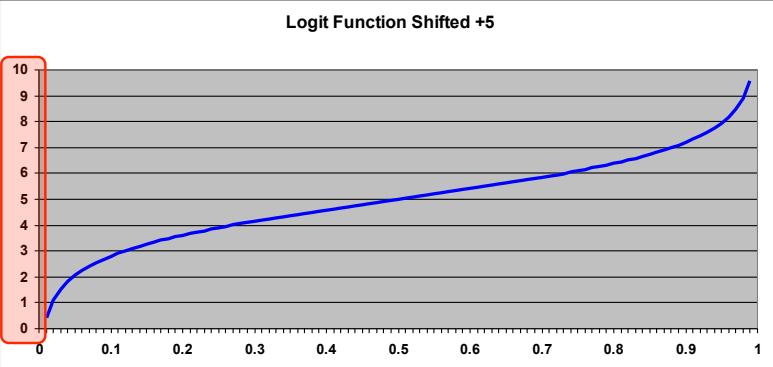

"Reducing the world to mathematical equations!"

Logit Function

$$y = \log_e(x/(1-x)) + 5$$

Logit Function Shifted +5

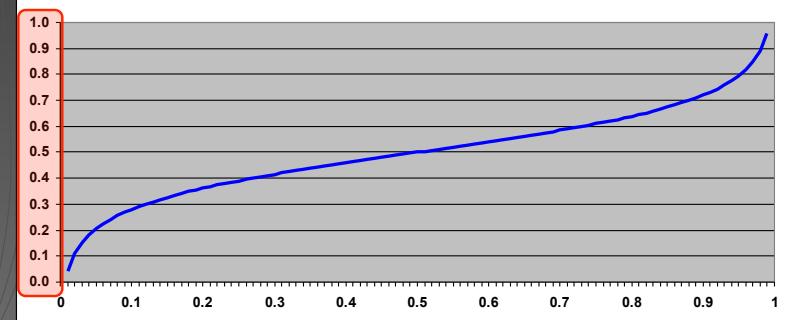

"Reducing the world to mathematical equations!"

Logit Function

$$y = (\log_e(x/(1-x)) + 5)/10$$

Logit Function Shifted +5 and Divided by 10

"Reducing the world to mathematical equations!"

How Do We Model Our Information?

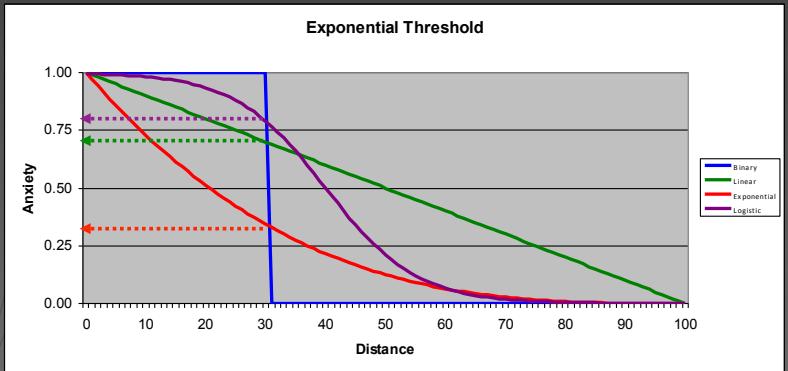

- Increasing or Decreasing?
- Rates of change
 - Steady or Variable?
 - Inflection Point?
- Amount of change
 - Constrained or Infinite?
 - Asymptotic?

"Reducing the world to mathematical equations!"

But What Good Is It?

When Anxiety > n then...

"Reducing the world to mathematical equations!"

Comparing Apples and Ammo

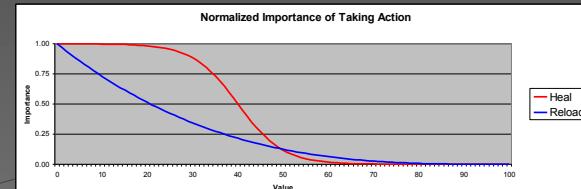

- By using normalized utility values, we can define relationships and comparisons that otherwise would have been obscure
 - Risk vs. Reward (game theory)
 - Fear vs. Hate
 - Ammo vs. Health

"Reducing the world to mathematical equations!"

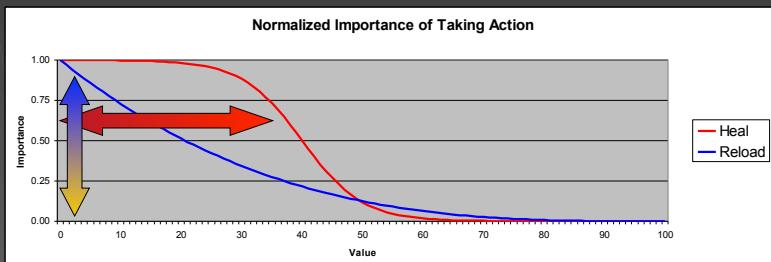

Comparing Apples and Ammo

- 100 Health (Max)
- 75 Health
- 50 Health
- 25 Health (??)
- 5 Health (!!!)
- 100 Ammo (Max)
- 75 Ammo
- 50 Ammo
- 25 Ammo
- 5 Ammo

"Reducing the world to mathematical equations!"

Comparing Apples and Ammo

"Reducing the world to mathematical equations!"

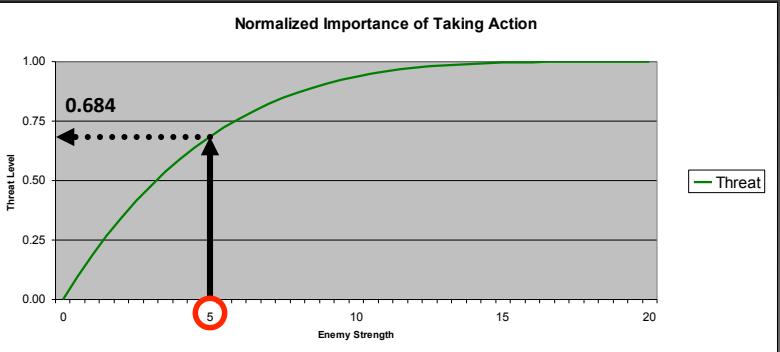

Comparing Apples and Ammo

- Collect current states of independent variables
- Normalize using response curves
- (Combine as necessary)
- Compare normalized values and select:
 - Highest scoring selection
 - Weighted random from all choices
 - Weighted random from top n choices

"Reducing the world to mathematical equations!"

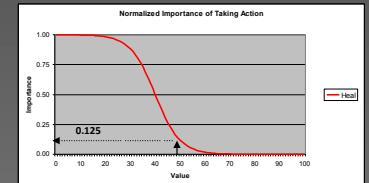

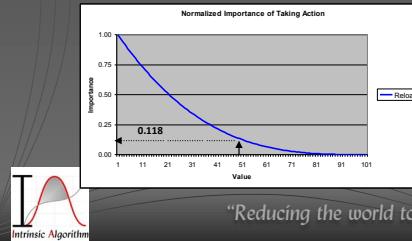

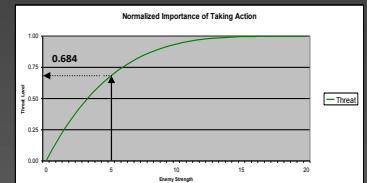

Comparing Apples and Ammo

"Reducing the world to mathematical equations!"

Comparing Apples and Ammo

	Enemies	Ammo	Health
Value	5	50	50
Utility	0.684	0.118	0.125

"Reducing the world to mathematical equations!"

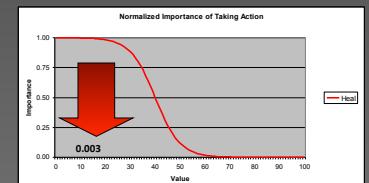

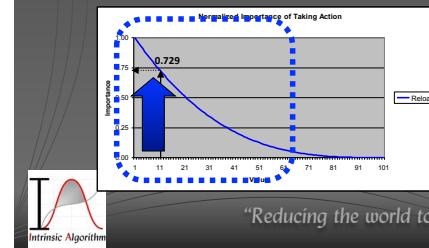

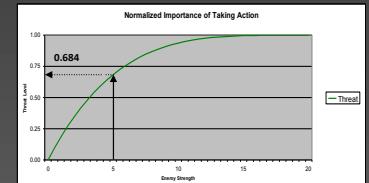

Comparing Apples and Ammo

	Enemies	Ammo	Health
Value	5	50	35
Utility	0.684	0.118	0.732

Comparing Apples and Ammo

	Enemies	Ammo	Health
Value	5	10	85
Utility	0.684	0.729	0.003

"Reducing the world to mathematical equations!"

Comparing Apples and Ammo

	Enemies	Ammo	Health
Value	0	75	50
Utility	0.000	0.016	0.125

"Reducing the world to mathematical equations!"

Beyond Apples and Ammo

- Utility measurements can model more than simply tangible data
- They can model abstract concepts:
 - Threat
 - Safety
 - Morale
 - Emotions

"Reducing the world to mathematical equations!"

Comparing Apples and Ammo

- Don't simply process 1 potential action at a time
 - Should I attack?
 - Should I reload?
 - Should I heal?
 - Should I have a beer?
- Compare all potential actions to each other
 - Of all of the things I could do, which is the most important *at this moment*?

"Reducing the world to mathematical equations!"

Stacking Apples and Ammo

- Individual utility value can be combined to form new conceptual utilities
- “Need to take cover”
 - Amount of fire being taken (Threat)?
 - Is it almost time to reload?
 - Is it almost time to heal?

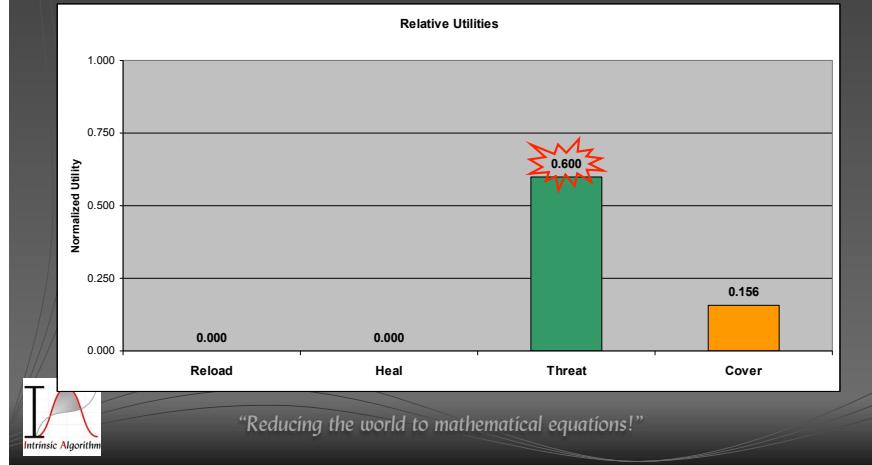

$$\text{Cover} = (0.2 + \text{Reload} + (\text{Heal} \times 1.5)) \times (\text{Threat} \times 1.3)$$

"Reducing the world to mathematical equations!"

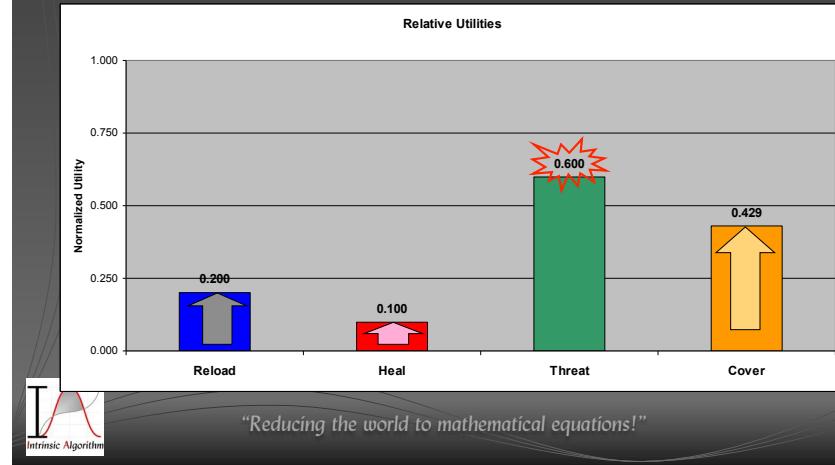

Stacking Apples and Ammo

$$\text{Cover} = (0.2 + \text{Reload} + (\text{Heal} \times 1.5)) \times (\text{Threat} \times 1.3)$$

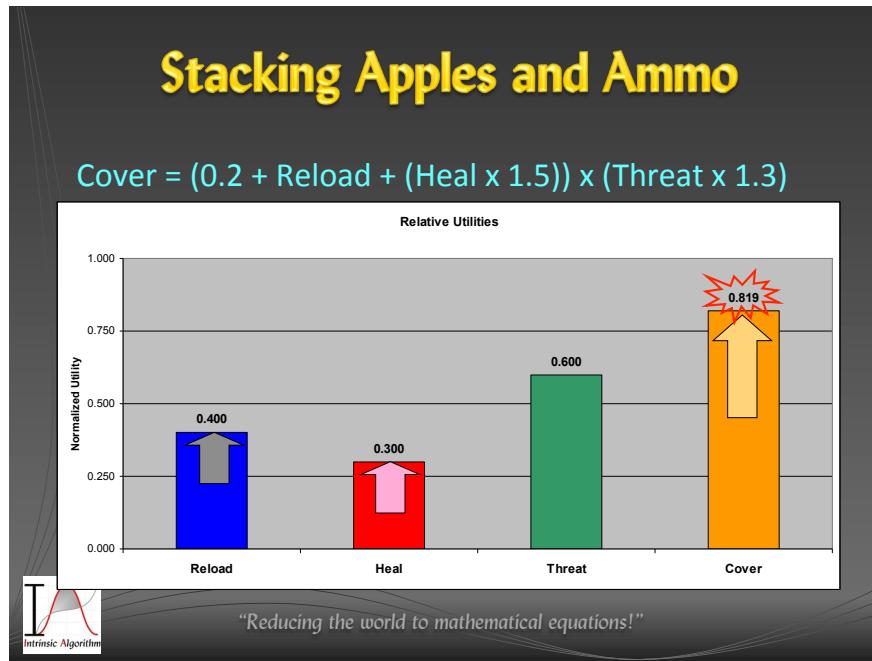

Stacking Apples and Ammo

$$\text{Cover} = (0.2 + \text{Reload} + (\text{Heal} \times 1.5)) \times (\text{Threat} \times 1.3)$$

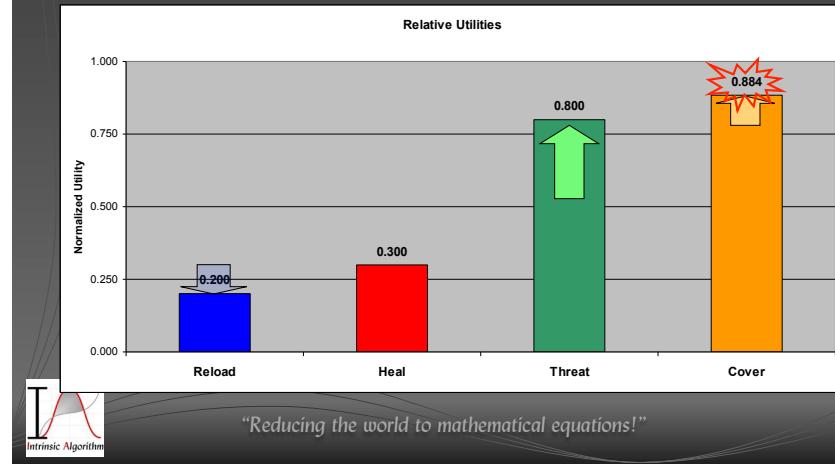

Stacking Apples and Ammo

$$\text{Cover} = (0.2 + \text{Reload} + (\text{Heal} \times 1.5)) \times (\text{Threat} \times 1.3)$$

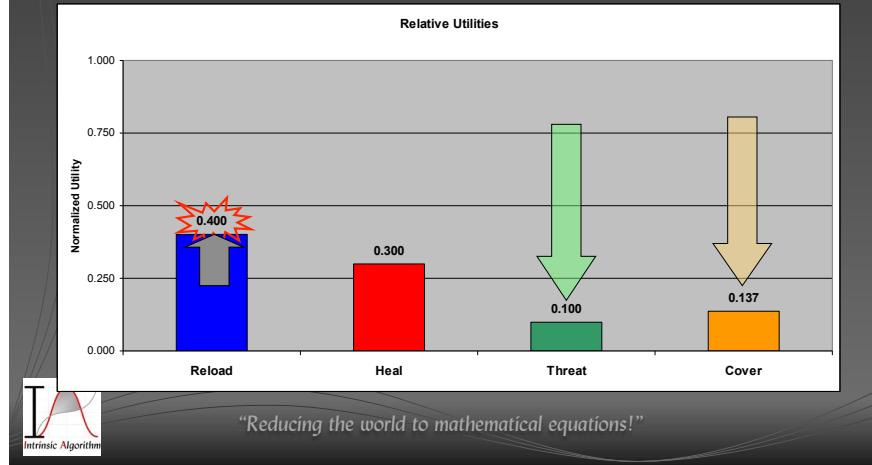

Stacking Apples and Ammo

$$\text{Cover} = (0.2 + \text{Reload} + (\text{Heal} \times 1.5)) \times (\text{Threat} \times 1.3)$$

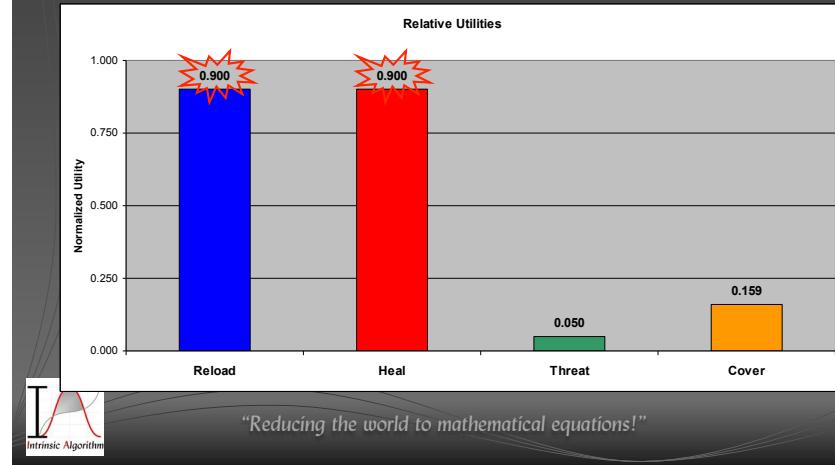

Stacking Apples and Ammo

$$\text{Cover} = (0.2 + \text{Reload} + (\text{Heal} \times 1.5)) \times (\text{Threat} \times 1.3)$$

Stacking Apples and Ammo

$$\text{Cover} = (0.2 + \text{Reload} + (\text{Heal} \times 1.5)) \times (\text{Threat} \times 1.3)$$

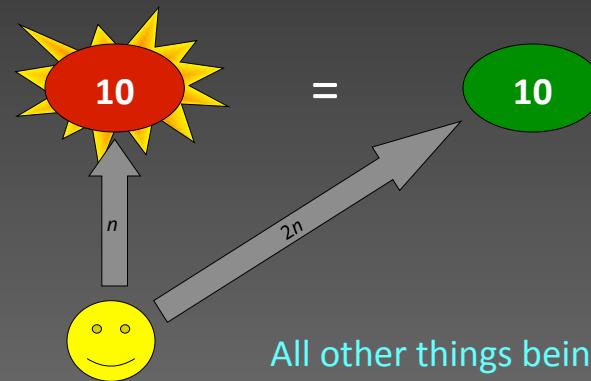

Utility of Time

- Time can be converted into a utility value
 - Time to travel over distance
 - Time to complete something
- Utility of time can be used for comparisons
- Utility of time can modify other utilities

"Reducing the world to mathematical equations!"

Utility of Time

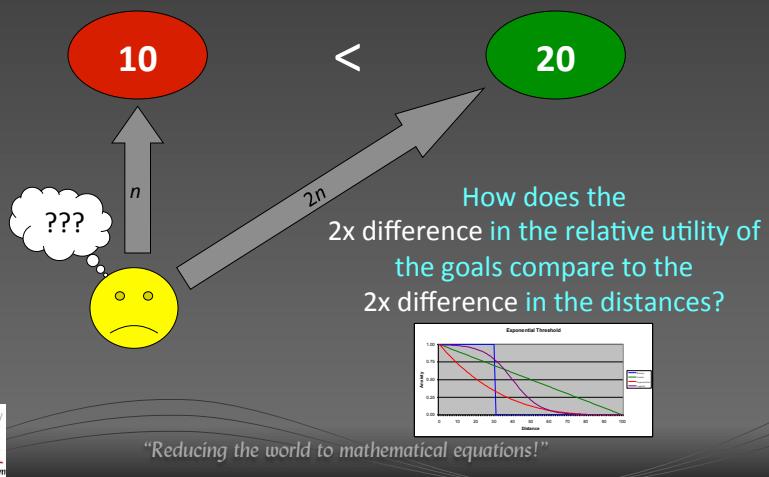

All other things being equal,
select the closest goal

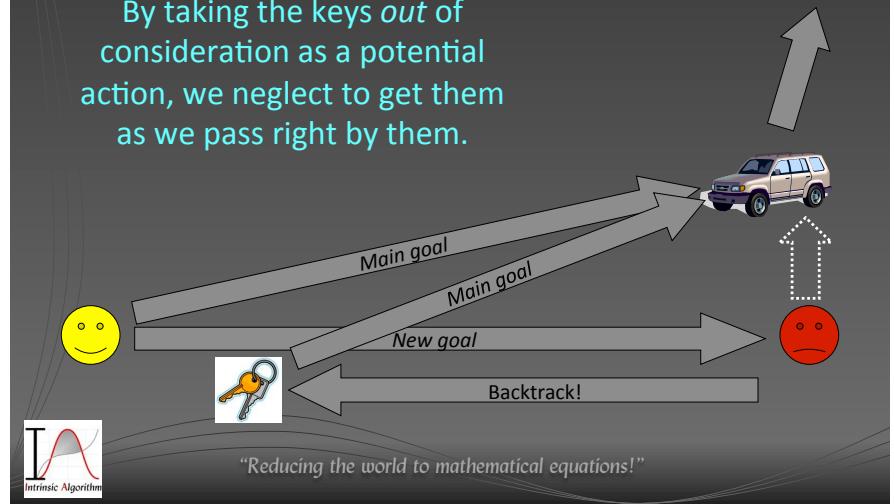

"Reducing the world to mathematical equations!"

Utility of Time

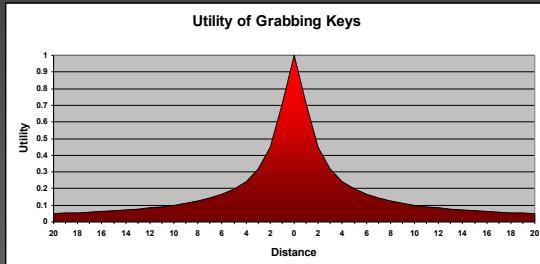

Utility of Time

By taking the keys *out* of consideration as a potential action, we neglect to get them as we pass right by them.

Utility of Time

$$\frac{1}{Dist_{keys}}$$

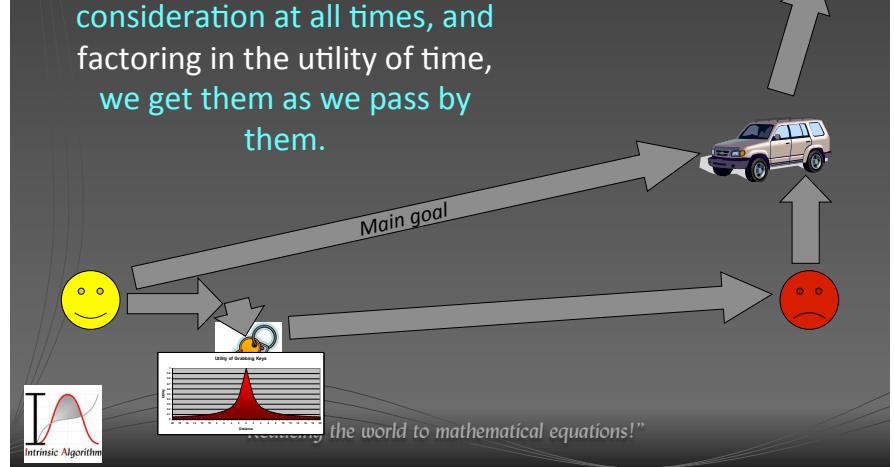

- Normalized distance utility as inverse of distance
- Use as coefficient to modify base utility of getting keys

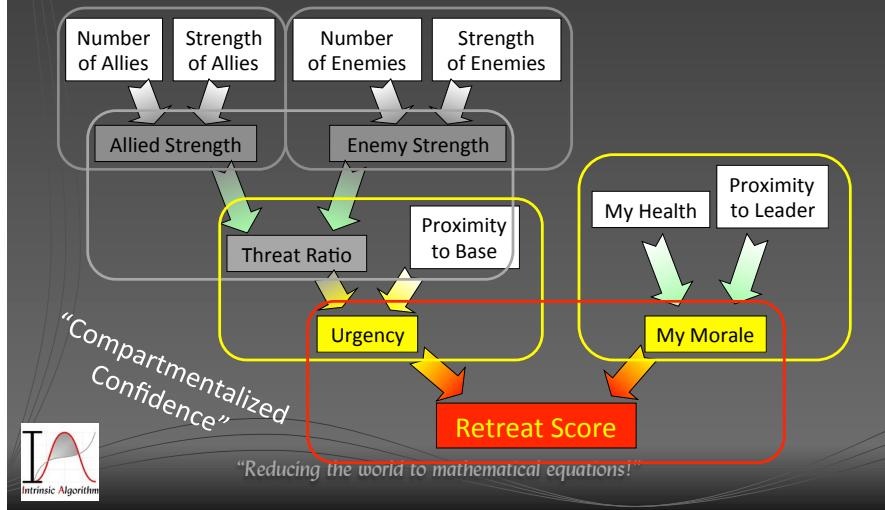

"Reducing the world to mathematical equations!"

Utility of Time

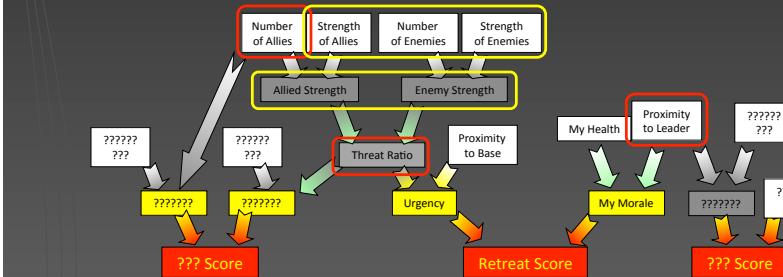

By keeping the keys *in* consideration at all times, and factoring in the utility of time, we get them as we pass by them.

Stacking It All Up

Spreading It All Out

Data processing != Decision processing

Managing Scalability

- Don't perform all calculations every frame
 - Every n frames
 - Use triggered updates
- Split data calculation off into separate processes
 - Used by multiple utility calculations for same agent
 - Used by decision calculations for multiple agents
 - Blackboard architecture to manage and store
- Lends itself well to multi-threading

“Reducing the world to mathematical equations!”

Everything is Relative

- Many AI decision processes (BTs, FSMs):
 - Examine one choice at a time and ask “should I do this one thing?”
 - Are certain parameters met to justify that choice?
 - If not, move on to the next one in a pre-specified order
- What happens if no options meet their criteria?
 - Fall back (idle) behavior may not be appropriate
 - Very susceptible to edge cases

“Reducing the world to mathematical equations!”

Everything is Relative

- Utility-based architectures:
 - Continuously analyze all options (rather than just one)
 - Rate all options based on their respective factors
 - Select the option that is most appropriate at the time
- Not based on arbitrary, independent thresholds
- Handles situational edge cases better
- Easier to manage potentially conflicting logic

"Reducing the world to mathematical equations!"

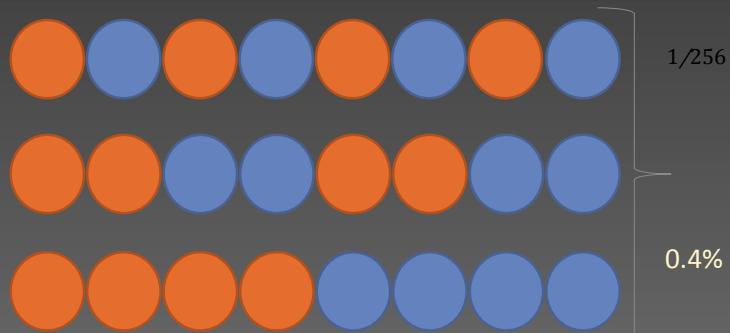

Randomness

Kaudoowee??

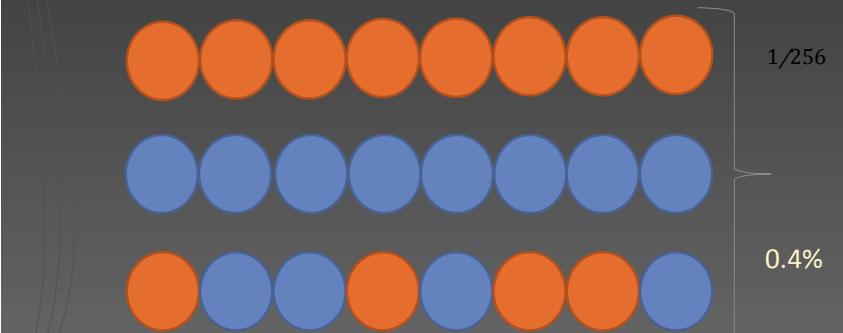

"Reducing the world to mathematical equations!"

Eye of the Beholder

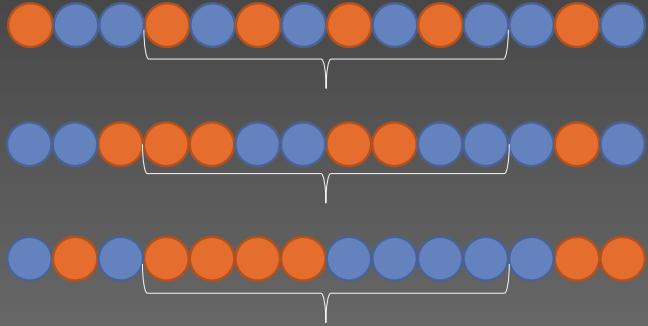

"Reducing the world to mathematical equations!"

Eye of the Beholder

"Reducing the world to mathematical equations!"

Eye of the Beholder

"Reducing the world to mathematical equations!"

Eye of the Beholder

- People are conditioned to see patterns
 - Inflate their importance
 - Easier to recall
- Chunking
 - Packaging info into memorable chunks
- “The magical number 7, plus or minus 2”
 - George A. Miller, Princeton, 1956

"Reducing the world to mathematical equations!"

Eye of the Beholder

- People can identify shorter patterns or groupings.
- Forget to consider the entire context

"Reducing the world to mathematical equations!"

Opportunity != Outcome

- The long-term odds (or % chance) of an event happening can be a poor predictor of short term results.
- People suck at remembering that.
- People suck at calculating that.
- It can be used for good or eeevviiilllll!

"Reducing the world to mathematical equations!"

Opportunity != Outcome

**"But I had 3...
and he only had 1!"**

**"But I had 1...
and he only had 3!"**

Sid Meier

"Reducing the world to mathematical equations!"

That's a lot of games...

- Statistically significant –
 - i.e. weaker team wins < 5% of the time
 - Stronger team has 66.7% advantage
 - Best 12 out of 23
 - Stronger team has 55% advantage
 - Best of 135 out of 269!

"Reducing the world to mathematical equations!"

Opportunity != Outcome

7-game series (e.g. baseball, basketball)

Team A has a 55% chance
of winning each game

Team B will win series
40% of the time

Team A has 66.6% chance
of winning each game

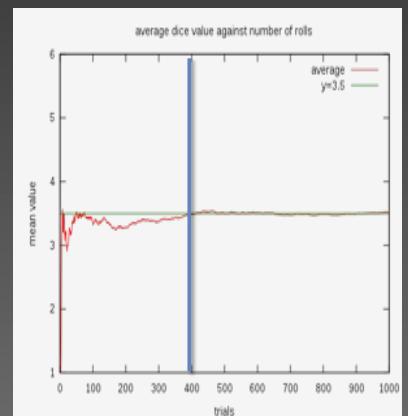

Team B will *still* win series
20% of the time

"Reducing the world to mathematical equations!"

Law of Large Numbers

As the number of trials
increases, the outcome
approaches the theoretically
expected value.

"Reducing the world to mathematical equations!"

When Is it “Large Enough”?

To achieve a 90% chance of getting within $\pm n\%$.

Statistical Significance	Minimum Trials
$\pm 5\%$	370
$\pm 2\%$	1000

(Think polls)

“Reducing the world to mathematical equations!”

Law of... *small numbers*?

- Kahneman & Tversky
 - Judgment and decision-making
 - Behavioral economy
- Sarcastic reference to misconception that a small sample accurately reflects underlying probabilities.

“Reducing the world to mathematical equations!”

Gambler’s Fallacy

- Idea that the odds of an independent event with fixed probability changing based on recent occurrences.
 - “Catching up.”
 - “His luck will run out sooner or later.”
 - “He’s due!”

“Reducing the world to mathematical equations!”

We all do it...

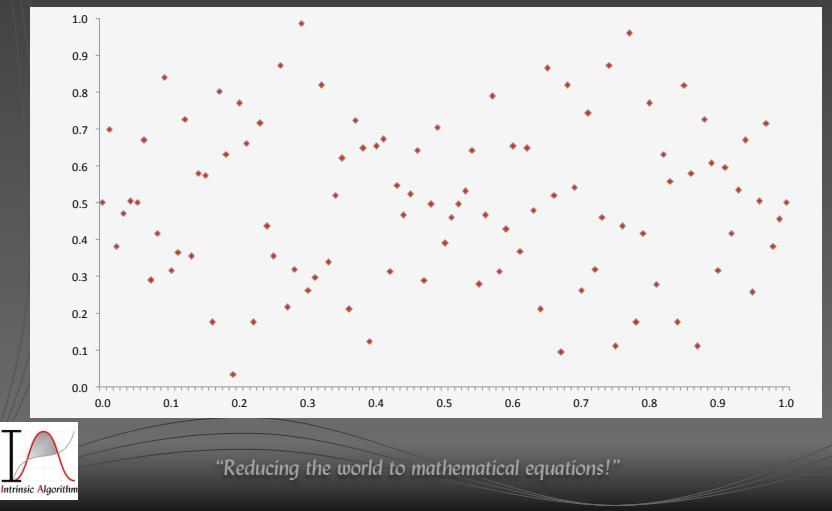

22	6	4
14	19	00
20	22	24
35	13	31
30	8	29
4	17	25
11	31	17
24	10	35

“Reducing the world to mathematical equations!”

What do People Perceive?

Determinism that Looks Random

- 3 Sine waves
 - Different frequencies
 - Different magnitudes
- For each value of x
 - Sum y values
 - Normalize

$$f(x) = \frac{\sum_{n=1}^3 magnitude_n \times (\sin(x \times period_n \times \pi))}{\sum_{n=1}^3 magnitude_n}$$

Period	50	133	271
Mag.	1.0	1.1	2.0

"Reducing the world to mathematical equations!"

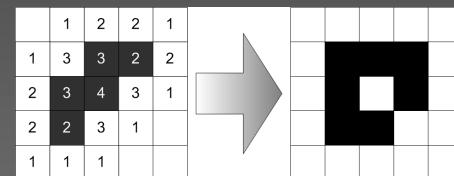

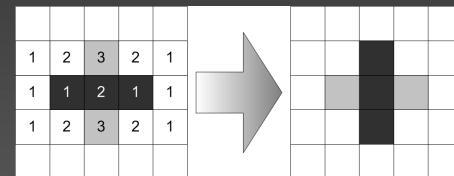

Complexity Obscures Patterns

- People can only keep track of a limited number of factors
- As factors increase, complexity increases
- People can no longer keep track of relationships
- Deterministic result looks “random”

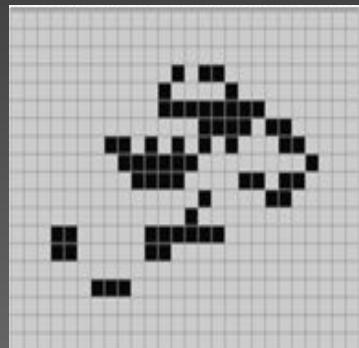

"Reducing the world to mathematical equations!"

Complexity Obscures Patterns

"Reducing the world to mathematical equations!"

Complexity Obscures Patterns

"Reducing the world to mathematical equations!"

Hidden Factors Look Random

- People can only take into account what they *perceive*
- If input factors are **hidden**, people ascribe it to randomness

"Reducing the world to mathematical equations!"

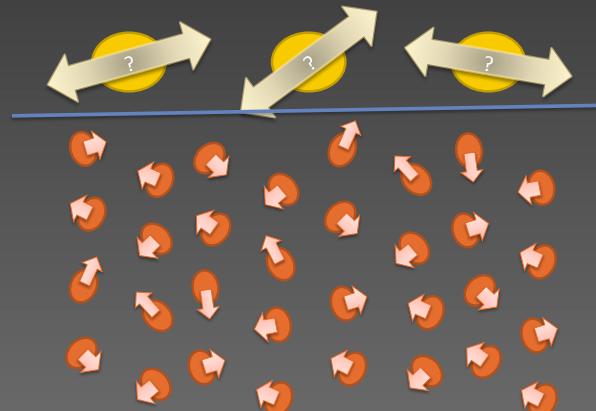

Brownian Motion

- Robert Brown – 1827
- Under a microscope – pollen grains moved in “jittery” manner
- Ascribed it to pollen being alive
- Heat-based molecular vibration bumping the grains

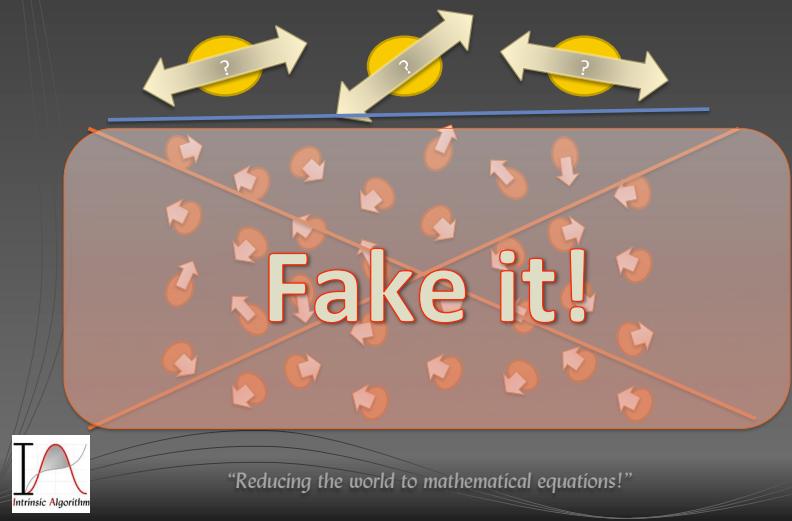

"Reducing the world to mathematical equations!"

Brownian Motion

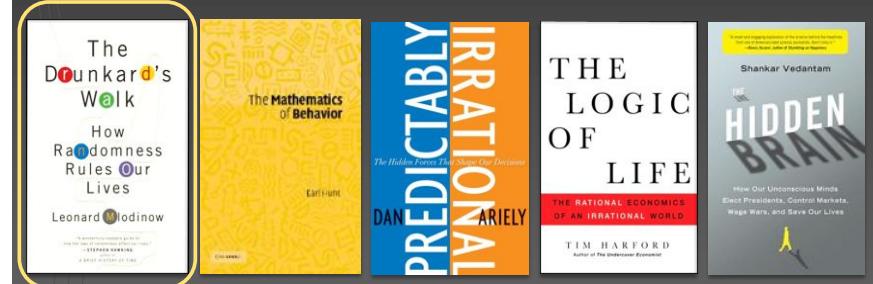

"Reducing the world to mathematical equations!"

Brownian Motion

Further Reading

"Reducing the world to mathematical equations!"

So what can we do with this?

- Random sequences that look rigged...
- Unseen deterministic factors that look random...
- Intentional randomness to fake complex determinism...

"Reducing the world to mathematical equations!"

Two Ways to Use It

- Fuzzing Things Up
- Weighted Randoms

"Reducing the world to mathematical equations!"

Fuzzing Things Up

twitter

"Reducing the world to mathematical equations!"

Fuzzing Things Up

- Start with a defined anchor point
- Add “parametric noise” (i.e. $\pm n$)

"Reducing the world to mathematical equations!"

Fun with Distributions

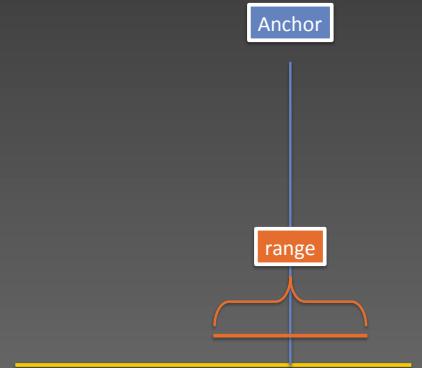

- 1 die = flat \pm
- 2 die = triangular distribution
- 3+ die = bell curve
 - More die \rightarrow squished curve
- Fun tricks
 - Skewing dist. (e.g. 4 die, drop the lowest)
 - Combining different types of dice

"Reducing the world to mathematical equations!"

Single Die

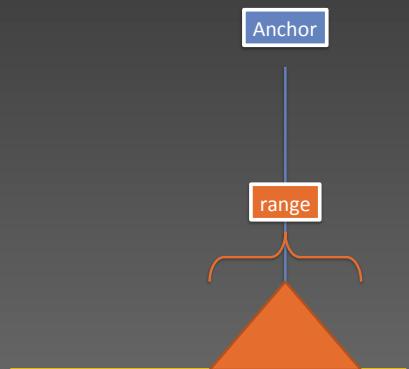

- Adds variation
- Quick to process
 - Single random call
- Easy to visualize
- Easy to tweak

"Reducing the world to mathematical equations!"

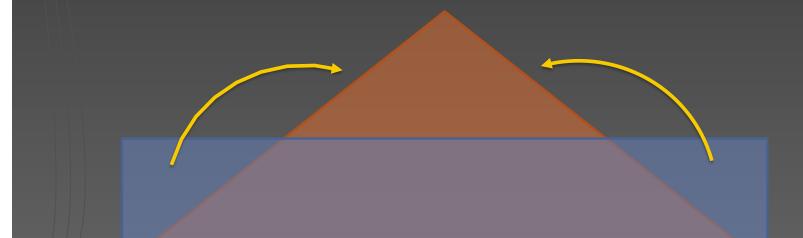

2 Dice

- Triangular distribution
- Mostly clustered towards center
- Fairly quick to process
 - Two random calls
- Easy to visualize
- Easy to tweak

"Reducing the world to mathematical equations!"

1 die vs. 2 dice

"Reducing the world to mathematical equations!"

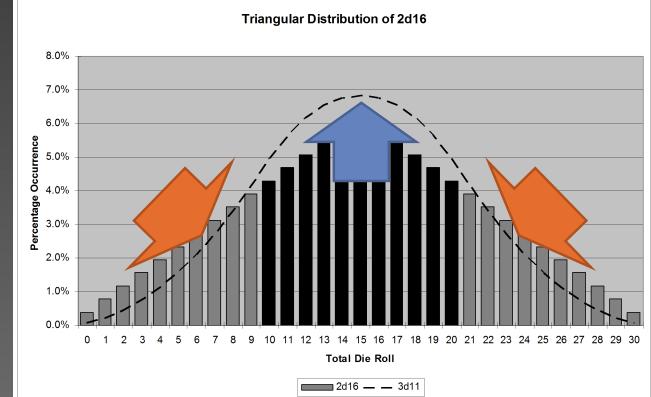

3+ Dice

- Normal distribution
 - Gaussian distribution
 - Bell curve
- Very clustered towards center
- Very expressive
- Slower to process
 - n random calls
- Harder to tweak

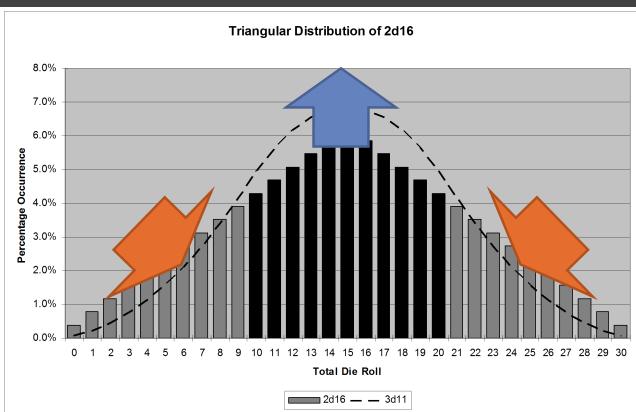

"Reducing the world to mathematical equations!"

3+ Dice

"Reducing the world to mathematical equations!"

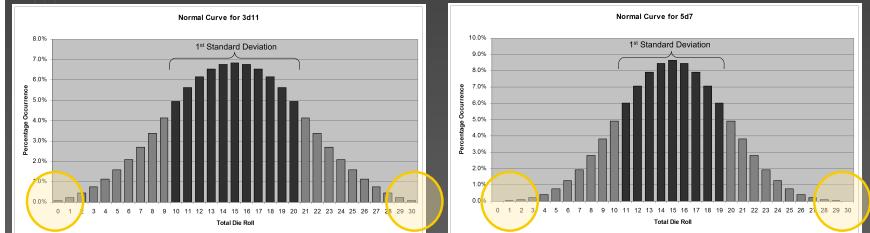

Increase the Number of Dice

"Reducing the world to mathematical equations!"

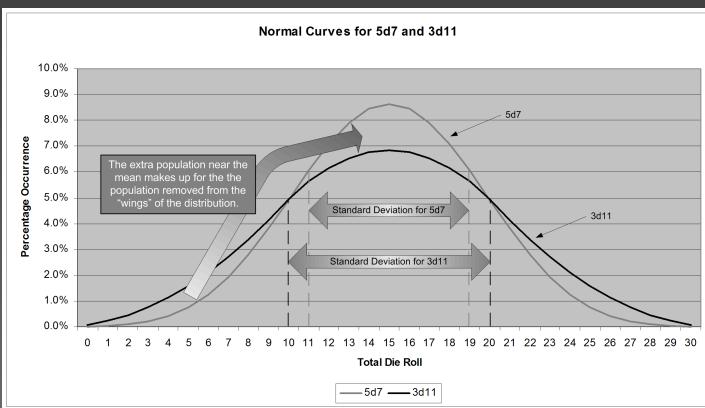

3 dice vs. 5 dice

"Reducing the world to mathematical equations!"

3 dice vs. 5 dice

"Reducing the world to mathematical equations!"

Where to Use Randomness

- Perception
- Decision
- Action

"Reducing the world to mathematical equations!"

Where to Use Randomness

- Perception
- Decision
- Action

"Reducing the world to mathematical equations!"

Where to Use Randomness

- Perception
- Decision
- Action

"Reducing the world to mathematical equations!"

Randomizing Perception

- Range
 - I can see $30' \pm 5' = [25-35']$
- Accuracy
 - I have an 80% chance of seeing you $\pm 10\%$
- Frequency
 - Check senses every n ticks where n is 500-2000 ms

"Reducing the world to mathematical equations!"

Where to Use Randomness

- Perception
- Decision
- Action

"Reducing the world to mathematical equations!"

Randomizing Actions

- Delay before acting
- Speed of acting
- Acceleration into act

"Reducing the world to mathematical equations!"

Clap when you see the light...

FredFoto.com

"Reducing the world to mathematical equations!"

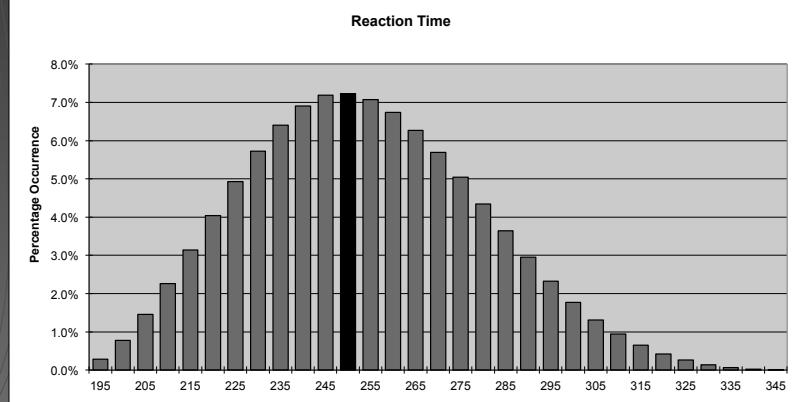

Human Response Times

- Average is ≈ 250 ms
- Not everyone clapped at 250ms
- Distributed over a range
- Everyone clapping at 250ms would be odd

"Reducing the world to mathematical equations!"

Human Response Times

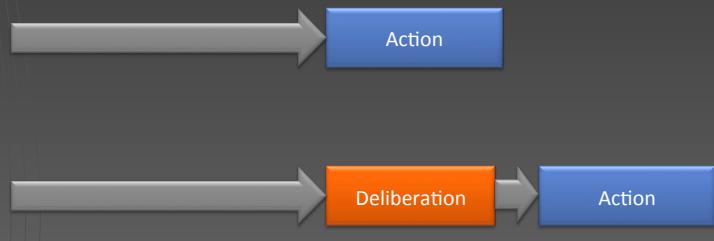

"Reducing the world to mathematical equations!"

Deliberative Decisions Take Time

"Reducing the world to mathematical equations!"

Deliberative Decisions Take Time

"Reducing the world to mathematical equations!"

Action Parameters

- Reaction Time
 - Initial (startle)
 - With decision
- Movement
 - Max speed
 - Acceleration
 - Turn rate
- Combat
 - Acquisition time
 - Fire rate
 - Accuracy
 - Reload speed
- [Whatever]

"Reducing the world to mathematical equations!"

What is different?

- Each person is different
 - People have different reflexes and reaction times
 - Why I can't play twitch games very well
- Each action is different
 - Every time you clap after the light, it will be different

"Reducing the world to mathematical equations!"

Instantiation vs. Action

Individual People

- Parameter's base value for all people
- Fuzzy it up a bit
- New base value for this person

Isolated Events

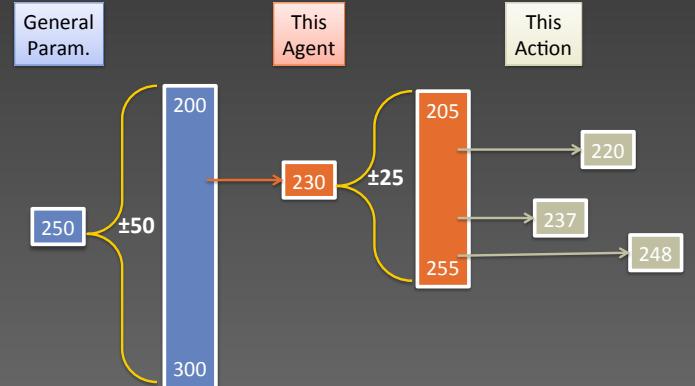

- Take base value for this person
- Fuzzy it up a bit
- New value for this event

"Reducing the world to mathematical equations!"

This Action

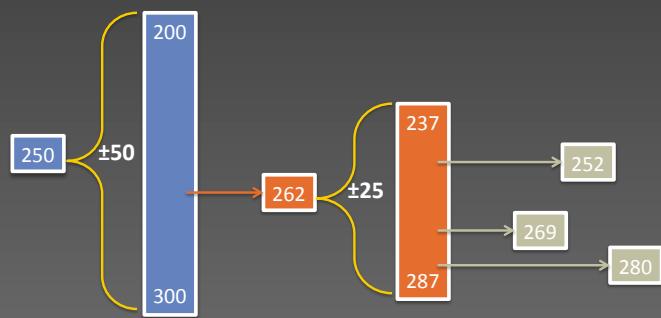

"Reducing the world to mathematical equations!"

Where to Use Randomness

- Perception
- Decision
- Action

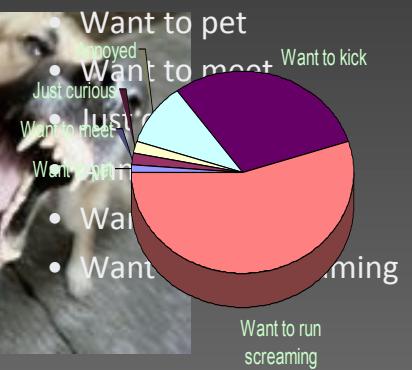

"Reducing the world to mathematical equations!"

What is your reaction?

Now what is your reaction?

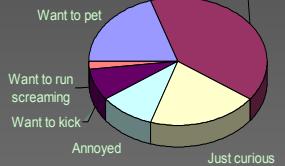

"Reducing the world to mathematical equations!"

"Reducing the world to mathematical equations!"

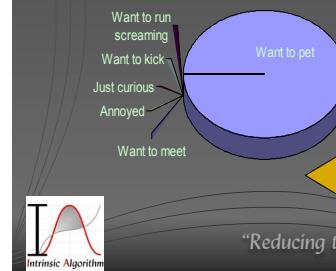

Varieties of Reactions

"Reducing the world to mathematical equations!"

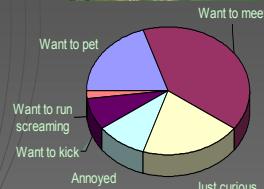

Same Model for All Agents

"Reducing the world to mathematical equations!"

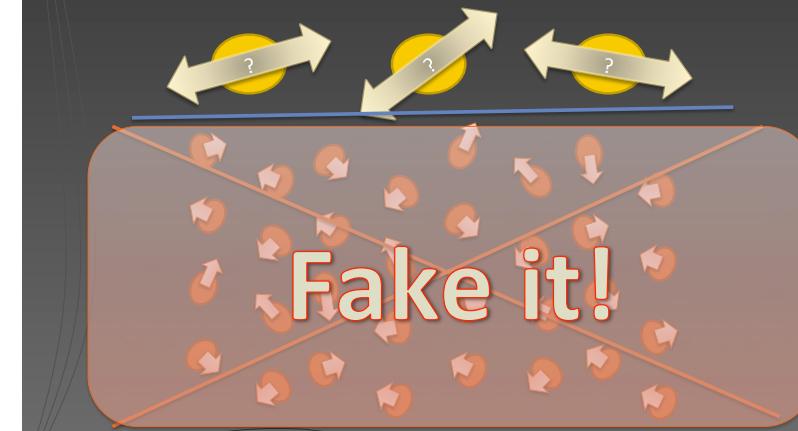

Varieties of Reactions

"Reducing the world to mathematical equations!"

- Differences exist
- Don't need to know why
- Simulate that differences do exist
 - Not completely random selection
 - Must be reasonable
 - Can be simulated with weighted randoms

Brownian Motion

"Reducing the world to mathematical equations!"

Multiple Agents – Multiple Reactions

Straight Deterministic Method

- Same inputs
- Same decision algorithms
- Arrive at a decision
- Same results

Random Noise Method

- Same inputs
- Same decision algorithms
- Randomized selection
- Varied results

"Reducing the world to mathematical equations!"

Weighted Randoms

Different Ways of Deciding What To Do

- ❖ Always choose the highest-scoring action
- ❖ Choose randomly from one of the n highest-scoring actions
- ❖ Choose randomly using the score distribution as the probability distribution

"Reducing the world to mathematical equations!"

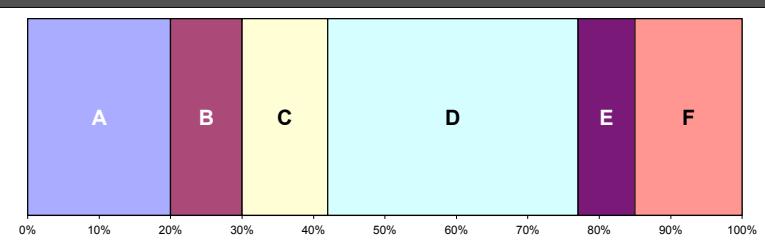

Weighted Randoms

- Score all the possible actions
 - Pre-set %
 - Contextual %
 - Dynamic %
- Calculate a weight
 - Normalized or not
- Line them up end-to-end
 - Convert weights into edges
 - Creates “buckets” sized based on weights
- Throw a random at it
 - Which bucket does it land in?

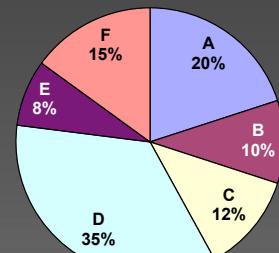

“Reducing the world to mathematical equations!”

Let the bouncing ball choose!

“Reducing the world to mathematical equations!”

Throw a Dart at It

“Reducing the world to mathematical equations!”

The Payoff of Weighted Randoms

- People aren't all the same
- There are reasonable options
- Simulate how reasonable people may differ
- Utilize the scoring of actions that we already do
- Just do more than simply choose the “best”

“Reducing the world to mathematical equations!”

We Aren't Solving an Equation

- Computers are good at finding “the best”
- People suck at it
- Pollen grains aren’t alive
 - They shouldn’t move
 - But they do (randomly?)
- People are alive
 - They should be different
 - List the likely decisions and pick (randomly)

“Reducing the world to mathematical equations!”

Don’t “solve”
human behavior...
Describe it!

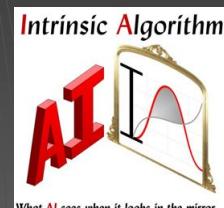

“Reducing the world to mathematical equations!”

Make Larry Proud!!
